Introduction

This report describes the residency matching process and provides residency program match information for Touro University College of Osteopathic Medicine (TUCOM) students for the most recent 5-year period (2016-2020). Residency match outcomes are important indicators to institutions, faculty, students and prospective students throughout the continuum of osteopathic medical education. However, the outcomes themselves are just the final datum in a complex and contingent process that each student navigates individually. This report presents residency match outcomes as much as possible in the context of how students make decisions.

Physician training can be classified into three phases, part of one of which encompasses 'residency': Undergraduate Medical Education (**UME**), Graduate Medical Education (**GME**), and Continuing Medical Education (**CME**). **UME** is the four or more years of medical school training following graduation from college. **GME** includes required training commonly referred to as 'residency' and optional later training such as fellowships. The required residency training takes place in hospital or health center facilities after graduation from medical school. Residency programs of one year duration are referred to as 'internships', Transitional Year programs, or 'preliminary programs' in reference to their role as qualifying experiences for subsequent training. The shortest length of a complete residency program is 3 years and is referred to as 'categorical'. For some 4-year programs the training can be either continuous in the subject at the same facility (*i.e.*, categorical), or divided into an internship in Year 1 (at any qualifying program) and continuous subject training in Years 2 -4 ('advanced'). Within a subject GME training is uniform in length (e.g., all Family Medicine programs are 3-years in duration, all General Surgery programs are 5-year, etc), with Neurosurgery being the longest at 7-years. CME is the series of annual learning activities that all physicians must complete in order to remain current and informed in their field of practice.

To obtain a state license to practice medicine a medical school graduate must complete a minimum of one year of GME training, commonly referred to as 'internship'. In many states, including California, the minimum requirement is completion of a 3-year categorical GME residency training program.

The trajectory of physician training is important to understand because the residency match is a point in the trajectory but is not the only path that determines a physician's ultimate medical practice. Residency contracts typically begin as Year 1 contracts only, after which the original residency match is renewed contractually by mutual agreement. This is relevant because a school's match report captures the results of the initial residency match as opposed to an accurate count of how many graduates will go on to practice medicine in each specialty. And, as noted below, students who match initially into only a Transitional Year or preliminary position may not be counted in a match report because their ultimate specialty choice is determined after they are no longer an active student. This can apply also to graduates in the military match, for whom deferments of complete residency training until after completion of military service is common.

Guide to Acronyms and Key Terms

ACGME – *American Council of Graduate Medical Education* - the once allopathic residency accrediting agency that now accredits all Graduate Medical Education training in the US.

Advanced – refers to a residency training program that separates the first year of training into an independent internship; in the match cycle an applicant would apply simultaneously to advanced programs and to preliminary or transitional year programs in order to cover the full extent of their residency training. Advanced programs exist in Anesthesiology, Child Neurology, Dermatology, Neurology, Ophthalmology, Physical Medicine and Rehabilitation, Radiation Oncology, and Radiology.

Categorical – refers to a residency training program that offers the complete tenure of training, without need for an independent internship year. Ophthalmology is the only discipline that does not offer categorical program training.

CME – *Continuing Medical Education*, the annual requirement of physicians to advance their competency after completing formal Graduate Medical Education.

Fellowship – Optional focused training after residency in a specialized practice of a residency discipline. Cardiologists, for example, typically have completed a Cardiology Fellowship after an Internal Medicine residency. Fellowships vary in length and typically are required in order to become certified by the relevant specialty practice board (i.e., ‘Board Certified’).

FMG – *Foreign Medical Graduate* – refers to non-US citizens who have completed medical training outside of the US and who are considered eligible to train in US residency programs.

GME – *Graduate Medical Education*, the scope of formal training options after graduating from medical school that includes internships, residencies and fellowships.

IMG – *International Medical Graduate* – refers to a US citizen who has completed medical training outside of the US (e.g., at Canadian, European or Caribbean medical schools) and is considered eligible to train in US residency programs.

Initial Match Rate – refers to the percentage of people matched by the NRMP main residency match algorithm, and typically totals approximately 90% of all US MD and DO applicants in the cycle.

Internship – an informal term that refers to the first year of GME; internship can refer to the first year in a categorical residency or to an independent preliminary or Transitional Year program of one year duration. All licensed physicians in the US must have completed an internship year of GME training.

NRMP – *National Residency Matching Program* - the independent body that executes the ACGME match exclusive of Ophthalmology, Plastic Surgery, Urology, and students matching through the US Military Health Professions Scholarship Program.

Overall Match Rate – refers to the percentage of people matched at the end of the NRMP main residency match cycle, the SOAP period, and the Scramble period. Given the higher total number of residency positions compared to US MD and DO applicants, the overall match rate for most US medical schools ultimately converges on 100%.

PGY – *.Post-Graduate Year* – a shorthand version of noting the specific year of residency (e.g., a PGY-3 is a third-year resident)

Post-Match – informal term that refers to the period after the initial residency match results are determined by the NRMP. The initial match results derive from an optimization algorithm involving all applicants and all residency programs.

Approximately 90% of all US MD and DO applicants are matched by this algorithm. Unmatched applicants and programs then enter the Post-Match period which includes a formal period (SOAP) and an informal continuation (Scramble). Results that combine the initial match outcomes and the SOAP outcomes are celebrated nationally as ‘Match Day’.

Scramble – an informal term that refers to the period after the formal NRMP match cycle has concluded. At this time any remaining unmatched applicants and any unfilled residency programs are able to contract with each other outside of the NRMP process.

SOAP – *Supplemental Offer and Acceptance Program* – the formal ‘mini-match’ NRMP process that allows unmatched applicants and unfilled programs to enter a series of matching rounds over a 72-hour period following the determination of the initial match results. Results of the initial match and the SOAP are combined in the national release of match lists on ‘Match Day’ each year.

UME – *Undergraduate Medical Education* – the formal term for the period spent in medical school. An undergraduate college degree is required for admission to medical school, and a medical school degree is required for Graduate Medical Education.

The Match

In the residency match process students rank the programs they prefer to match and programs rank the students they prefer to have matched. The algorithm drives the student list against the subordinate program list. Results of the NRMP, Military, Ophthalmology and Urology matches are binding, such that each student can receive only a single match and is bound by match participation rules to accept it. As of the Class of 2020 the residency match process involves four* not-exclusive pathways, in the following chronological order:

- **Military Match (December)**
 - Military scholarship students rank military base programs and/or civilian deferment according to rules within their branch of service.
 - In some circumstances a student could participate in the military match but receive the option or direction to compete later in the year in the civilian matches.
 - A student who matches in this process is removed from the matching algorithm in the other processes.
- **ACGME Ophthalmology Match (January)**
 - Students interested in matching ACGME-accredited ophthalmology residency programs must apply through an organization called the San Francisco Match (sfmatch.org).
 - Decisions occur in January, prior to the main National Residency Matching Program (NRMP) cycle, so that unmatched students can participate in later opportunities to obtain a residency.
 - Students who match to advanced ophthalmology positions remain eligible to participate in the NRMP cycle in order to obtain a match for internship training.
- **ACGME Urology Match (January)**
 - Students interested in matching ACGME-accredited urology residency programs must apply through the American Urological Association.
 - Decisions occur in January, prior to the main ACGME match, so that unmatched students can participate in later opportunities to obtain a residency.
- **ACGME Match through NRMP (March) – the ‘main’ and largest match**
 - All ACGME-accredited residency programs other than those described above participate together in a single match administered by an independent party (National Residency Matching Program).
 - Graduating students and prior graduates of US-MD schools and DO schools, as well as US citizens trained in international medical schools and non-US citizens with approved foreign medical licenses may participate in this match.

** The match for Plastic Surgery is administered in two pathways, one (Integrated) through the NRMP match and one (Independent) exclusively for training that begins in Year 2 of residency and takes place through the San Francisco Match (sfmatch.org) in May, after students obtain a preliminary result in the NRMP ‘main’ residency match.*

Residency by the Numbers

All accredited residencies in the US completed merging into the ACGME Single Accreditation System in 2020. For the 2020 residency match (excluding the military match) there were slightly more than 40,000 unique applicants and slightly more than 37,000 total positions:

	Positions	Applicants		Total*
		US MD	DO	
Anesthesiology	1884	1328	408	2339
Child Neurology	193	117	22	193
Dermatology	538	458	58	692
Diagnostic Radiology	1146	712	170	1232
Emergency Medicine	2665	1853	808	3115
Family Medicine	4662	1515	1365	4913
General Surgery	1536	1194	273	2183
Internal Medicine	9127	3752	1456	10996
IM-Peds	390	344	40	445
Interventional Radiology	156	144	22	199
Neurological Surgery	232	270	15	383
Neurology	946	471	127	1068
OBGYN	1443	1260	308	1873
Ophthalmology	496	498	29	635
Orthopedic Surgery	849	860	172	1177
Otolaryngology	350	414	30	493
Pathology	603	208	69	748
Pediatrics	2956	1756	501	3102
PM&R	480	268	211	591
Plastic Surgery	180	229	12	282
Psychiatry	1858	1246	398	2486
Radiation Oncology	192	122	<7	169
Urology	357	371**		481
Vascular Surgery	75	78	9	122

*Including foreign medical graduates, US international citizens, and previous graduates

**The American Urological Association does not divide US MD and DO applicant totals.

The 2020 national initial match rate was 93.7% for US MD applicants, 90.7% for DO applicants, and approximately 61% for all other applicants.

Applying to Residency

Residency programs operate on the same academic calendar as do medical schools. As such, to begin residency on 1 July following graduation from medical school, graduating seniors will apply to residencies in the fall of their Year 4, interview through late fall and early winter, and be matched in March. A unique aspect of the main residency matching process is that all applicants and all programs participate in a simultaneous optimization of outcomes (the 'match'). Unlike for college or medical school, applicants do not receive multiple offers for residency and choose among them. Rather, applicants list the programs where they interviewed in the order of their true preference and an optimization algorithm 'matches' them to the best possible outcome on their list based on how the programs have ranked each applicant. The match produced by the algorithm is considered a binding contract. Thus, anxiety surrounding a student's ability to match 'high on their list' can be extreme, given the rigid nature of the results announced on national Match Day.

Importantly, the optimization algorithm that places each applicant in the best possible outcome based on their list cannot make such a match for all students, nor can it fill all of the available positions at all programs with the interviewees at that program. In recent cycles the algorithm has been unable to match approximately 5000 applicants (including MD, DO, foreign medical graduate applicants and US citizens of international medical schools) and was unable to fill 1000 – 2000 positions. This means that there are varying states of 'match results' for each medical school as the cycle proceeds from initial match to SOAP and then to the Scramble.

The initial results of the algorithm are released on the Monday of 'Match Week' in mid-March. Every applicant is informed that they have 'matched' or are 'unmatched' on that day, but they are not informed of where they have matched. (Military, ophthalmology and urology applicants already know their outcomes in those cycles at this point.) Schools are able to calculate their initial 'match rate' on this day but rarely publish that information because there are subsequent opportunities for their unmatched students to be matched. According to the NRMP the recent historical **initial match rate** of all allopathic medical schools combined is between 92-95%. The initial match rate of all osteopathic medical schools combined was 90.7% in 2020, the first year of the Single Accreditation System.

To resolve unmatched applicants and open positions the National Residency Matching Program runs a Supplemental Offer and Acceptance Program (SOAP) over the 72 hours following release of initial match results (Tuesday – Thursday of 'Match Week'). Unmatched students in the SOAP may apply specifically to unfilled programs. Through a series of offer rounds the NRMP algorithm tries to resolve both groups but never truly 'zeroes out' the ratios. After the 72-hour period of SOAP ends all remaining unmatched students and all remaining unfilled programs are free to communicate with each other and agree to a residency contract outside of the NRMP matching rules. This period is commonly referred to as 'the Scramble', and may last several weeks.

By the end of the post-Match SOAP and Scramble periods the typical overall match rate for graduating seniors for a medical school is very close to or equal to 100%. The TUCOM final match rate for graduating seniors in the 2016 – 2020 period was 99.25% in 2016 and 100% in years 2017 – 2020. These rates do not reflect, however, the number of students who do not receive an initial match and choose to extend their enrollment rather than graduate. Nor, as explained below, does the rate reflect the degree to which each student perceives their own match as a 'successful' outcome.

Guide to Understanding Residency Match Outcomes

Student application and match progress are private and confidential

Although school officials are aware of each student's applications to residency programs only the student is aware of whether or not they receive an interview. And communication rules expressly forbid school and residency officials from asking students about their progress (*e.g.*, how many interviews did you get?; did you match to your 1st choice?). It could be argued that any form of solicitation, such as an anonymous, 'voluntary', survey, of a student's outcome is a form of coercion. Medical schools that publish how many of their graduates receive their 1st (or any) choice in the residency match are reporting data obtained through 'voluntary' responses and/or incomplete census of the entire class. And, as noted below, several factors confound any singular meaning of where a student matches on their list.

Match rate is a function of specialty choice

Students are free to choose which type of medicine they train in for residency. But the number of available residency positions in each discipline is strictly limited. Some disciplines have more positions than there are US MD and US DO applicants. Others are close to parity in that ratio, and a number of medical specialties offer fewer residency training positions than the number of US MD and US DO graduates seeking them. Considering only US MD and US DO applicants, the ratios of applicants to positions in the 2020 match were, from high to low:

Plastic Surgery	1.34	Dermatology	0.96
Otolaryngology	1.27	General Surgery	0.96
Neurosurgery	1.23	Anesthesiology	0.92
Orthopedic Surgery	1.22	Psychiatry	0.88
Vascular Surgery	1.16	Diagnostic Radiology	0.77
OBGYN	1.09	Pediatrics	0.76
Interventional Radiology	1.06	Child Neurology	0.72
Ophthalmology	1.06	Radiation Oncology	0.67
Urology	1.04	Neurology	0.63
Emergency Medicine	1.00	Family Medicine	0.62
PM&R	1.00	Internal Medicine	0.57
IM-Peds	0.98	Pathology	0.46

The data above do not include foreign medical graduates or international US citizen graduates who comprise slightly more than 30% of the total applicant pool. Thus, it is inevitable that the national match rate will be < 100% for students applying to popular disciplines such as Orthopedic Surgery, Emergency Medicine, Physical Medicine and Rehabilitation, OBGYN, Urology and Ophthalmology. With the national match rate for US MD applicants to a discipline such as General Surgery being 83%, and 69% for US DO applicants, it is easy to see how a single school's initial match rate can vary simply based on how many of its graduates pursue saturated and over-saturated residency disciplines. Unmatched applicants to those disciplines may SOAP or Scramble into an available preliminary year position and ultimately be counted toward a school's '100%' match rate, but that rate does not reflect the ultimate versus intended outcome for each of those students.

The outcome that really matters is best defined by each student

A number of important student experiences are obscured when considering match rates and program matching results including, but not limited to:

- **Continuity of an applicant's desired outcome over time**
 - If an applicant originally desired to become a radiologist but received no interviews in Radiology, yet matched to the #1 program on their list among their back-up choices in Internal Medicine, they would be counted as having matched their #1 choice. But did that applicant really match to their 'true preference'?
 - Similarly, if an applicant originally desired to match Residency Program X but did not receive an interview from that program, yet matched to the #1 program on their list among the programs that did interview them, then did that applicant really match to their 'true preference'?

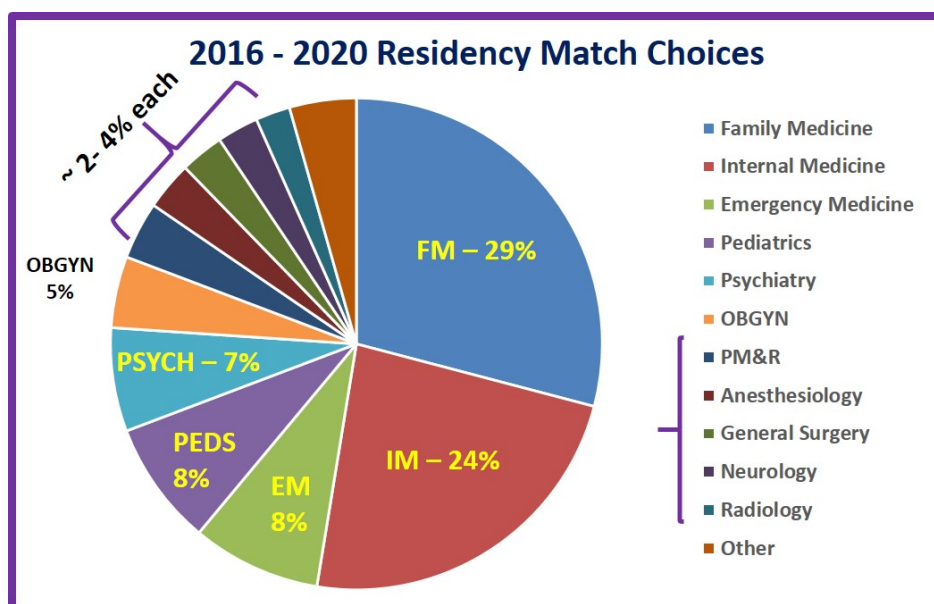

- **Real versus perceived meaning of 'top choice'**
 - One applicant's top priority in the match is to stay within their home region and they match to the 4th program on their list but are still able to stay in their home region. Another applicant has a high desire to match the #1 program on their list but matches to the 4th program instead. Are both applicants equally 'satisfied' or 'dissatisfied' with their outcome?
 - Similarly, one applicant has only 4 interviews and matches to the last program on their preference list; another applicant has 24 interviews and matches to the 4th program on their preference list. These outcomes are identical in one aspect, but definitely not necessarily equivalent in the students' experience.

- **Each applicant defines true preference differently**
 - A school's match list reflects, in large part, the program preferences of their graduates. For two applicants who match to the same residency program, the outcome may be a 'true' preference for one but not for the other (for reasons described above). Thus, a program that appears repeatedly on a school's match list does indicate a relationship between the students of that school and the 'legacy' of that residency program. But it does not indicate that all matches to that program represent the same preference outcomes for the students.
 - Similarly, if a residency program does not appear on a school's match list there is no way to determine if it is because students at that school are consistently unsuccessful at trying to match to that program (*i.e.*, are not 'competitive' because of where they went to medical school). It may simply mean that students at that school had the option of ranking the program but consistently ranked other programs ahead of it and matched to them. Thus, it is unwise to assume that a school's match list indicates the range (or limit) of training options for future students.

TUCOM 2016 – 2020 Residency Match Outcomes

Summary Results (categorical and advanced matches):

- 61% of matched students pursued primary care, including graduates in this period who matched first to a preliminary or transitional year position and then subsequently in a primary care residency.
- TUCOM graduates matched to programs in 42 different states and the District of Columbia during this period, but nearly half of all matches were concentrated on the west coast. 43% of matches were in California, continuing a 4-year and 6-year running average of 40% or higher in-state matches. 48.8% of all matches were to programs in CA, OR, WA, and HI, within the range of 43-50% west coast/Pacific matches each year since 2015.
- The high match rate in California reflects the priority of TUCOM graduates to remain in the state. At the same time, per capita, California has relatively few residency positions (ranking 28th among states in the US). In the 2020 match 297 DO seniors and DO graduates matched to residencies other than Transitional Year in California, and among them were 63 TUCOM students or graduates. Thus, TUCOM applicants constituted 2.1% of the overall DO applicant pool in the 2020 NRMP match, but 21.2% of all DO matches in California. Over the 2016 – 2020 time period TUCOM applicants have matched in California at a similar rate (e.g., 25.2% in 2016, 17% in 2017, 20% in 2018, 16% in 2019).
- Beginning with the Class of 2019 Emergency Medicine became the third most popular residency choice (behind Internal Medicine and Family Medicine), and continues to be so for the Class of 2021.
- TUCOM graduates matched into 21 of 26 different types of residencies in 2020, but the 6 most common choices in this period (FM, IM, EM, Peds, Psych, OBGYN) constituted >75% of all matches. Procedure-heavy specialties, including EM, constituted only 20% of all matches, compared to 80% for primary care and patient-based disciplines.
